

Electronic file exchange is the bedrock of e-commerce, accounting for as much as ninety percent of all B2B traffic. And with the lion's share of this traffic exchanged on the Internet, data security, flexibility and assured delivery are non-negotiable requirements for enterprise e-commerce programs.

MessageWay® is an Advanced Managed File Transfer (MFT) system that meets these critical requirements, and more. With **MW Transport**, your enterprise has access to a full suite of secure client and server protocols. And **MW Transport** provides a variety of scalable deployment options that also ensure compliance with the most rigorous IT security policies. **MW Transport** provides you with highly reliable IP-based communications and enables you to exchange files in complete confidence – on both sides of the firewall.

Consolidate and Modernize Transmission Systems

FTP servers and proprietary file movement clients often times proliferate below the radar. When coupled with ad hoc usage of scripts and file movement software behind the firewall, it is often impossible to know the source or 'genealogy' of enterprise files. **MW Transport** provides native client and server communications, as well as third-party adapters that allow you to consolidate all file movement and establish complete control and visibility over enterprise-wide file exchange.

Fortify Transmission Security

Security is a non-negotiable requirement for Internet-based e-commerce. **MW Transport** meets that requirement by providing perimeter servers for inbound and outbound communications that eliminate potential 'data at rest' issues in non-secured areas of your network. Whether receiving files from your trading partners or pushing files to them, data is securely streamed through your DMZ with internal IP addresses concealed from external partners. And **MW Transport** also provides deployment capabilities that conform to multi-tiered DMZ architectures,

accommodating even the most stringent security policies.

Scale as Business Volume Grows

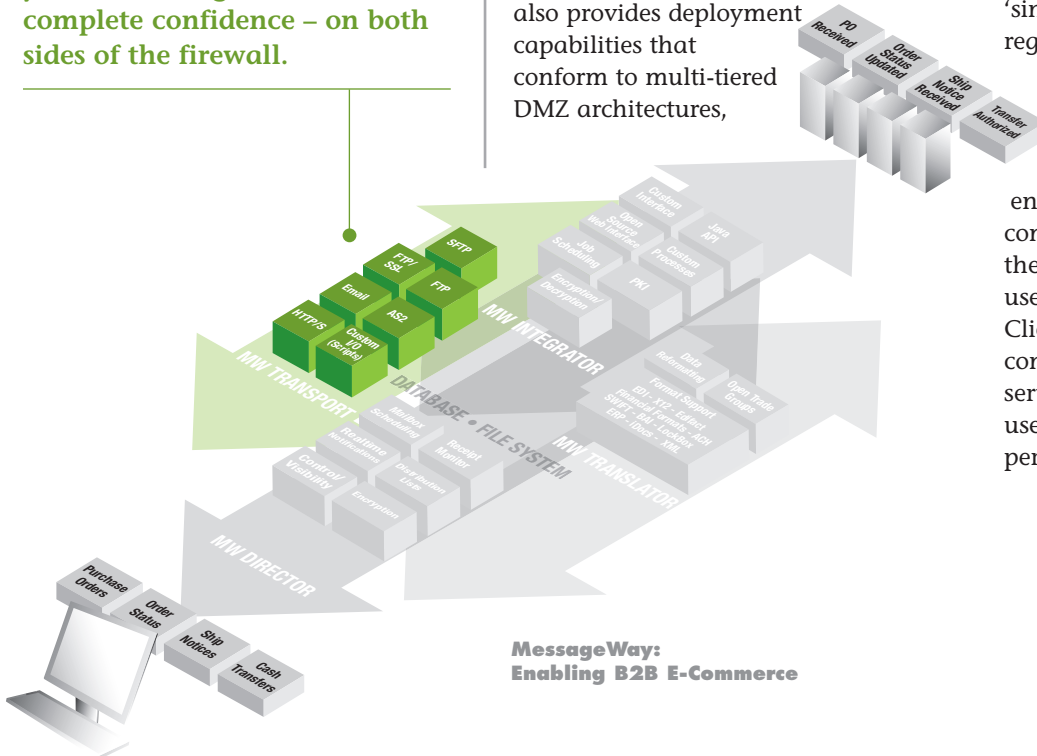

Perimeter servers can be network load-balanced across multiple physical or virtual host servers and configured to listen on multiple ports and subnets. This enables you to 'go wide' to accommodate all your trading partners, and align proxy deployment to match your protocol usage. With **MW Transport**, you can start with the number and type of perimeter servers that meets today's deployment needs and add as your volume grows.

Open and Proprietary File Exchange

MW Transport offers a wide range of communications alternatives. It provides a full complement of open protocols and can act as either server or client in a file exchange session. And the **MW Transport** communications adapters enable you to harness your proprietary or third party clients and run them under MessageWay control. This enables your enterprise to leverage all the MessageWay core services and present a 'single face' to your trading partners, regardless of their choice of protocol.

Guaranteed File Delivery

MW Transport employs persistent delivery techniques to ensure that either every transmission is completed, or that alerts are issued in the event of non-delivery. And when used in conjunction with MessageWay Client, **MW Transport** provides confirmation of delivery that is self-service accessible for remote system users, or for access by customer service personnel.

MessageWay:
Enabling B2B E-Commerce

MW TRANSPORT

With MessageWay, your organization can:

- Consolidate and modernize disparate transmission platforms
- Eliminate risks associated with script-based processing
- Secure your Internet file exchange and comply with enterprise security policies
- Fully automate and manage file transfer between your application environment and your customers, suppliers and service providers
- Tailor your communications environment to align with trading partner preferences
- Establish a common, secure file exchange platform for B2B, as well as cross-domain file movement inside the enterprise

Benefits:

- Establish full control over enterprise file exchange
- Comply with regulatory and audit requirements
- Maximize communications server utilization

MW Transport Communications

- Third-party proprietary B2B products
- SSH
- FTP
- FTP/SSL
- HTTPS
- SMTP/POP3
- AS2
- Network File System

Guaranteed File Delivery

- Automatic recovery from network interruptions
- Automated alert notifications for success/failure/not-arrived
- Persistent delivery and retrieval

Security

- Data streaming eliminates data at rest in DMZ
- Perimeter servers conceal internal IP addresses from system users

File Transport

- Event-driven real-time or batch push/pull
- Easily pre-configure delivery and retrieval retry rules
- Configure for time of day (with daylight savings offsets), data thresholds, or polling
- Supports 'lights out' operations, with real-time notifications
